

Reflection: Building My Portfolio with AI

Natthakrit Benjapatanamongkol · Student ID: 1561028

Process

I built my portfolio with Next.js 16, Tailwind CSS v4 and a small set of CSS design tokens, and deployed it on Vercel. My AI partner was Claude Code, working directly inside the project. I started from the Create Next App template and kept every fact about me in one file, *content.ts*, so the AI could build the layout around it: the About, Education, Experience, Work and Contact sections, in a light and dark theme. After the first version I worked in small rounds: fix the landing page, fix the responsive layout, then add a liquid glass effect to the navigation bar. Each round was one short prompt, a check in the browser, and a commit.

Human edits

The AI wrote most of the code, but I made the decisions about content. When it could not open the NeoCare chatbot, because Cloudflare blocks visitors from outside Thailand, it did not guess, and I wrote the description myself. It left the Research section as an empty placeholder, so I chose Focus, the project I am building now, and asked for a write-up without a link because the repository is private. I added my Chinese name and my KMITL program to the About section, since personal details are mine to state. I recorded these changes in a revision log in the README, which the site links to.

What I learned

First, AI is fast at work that is mechanical but tedious: CSS effects, layout fixes, and checking its own output with screenshots. The glass effect took minutes, including a test in headless Chrome. Second, AI cannot be the source of truth about me. Every fact on the page had to come from me or be checked by me. Finally, keeping a revision log made me explain each change, which showed me where my own judgment shaped the site. Working with AI felt less like handing off work and more like directing it: the AI does the typing, and I decide what is true and what looks right.
